

running example $H(x) = \sin(2x)(Z_0Z_1 + X_0 + X_1)$, $x = 0.7$, $T = 5.00\ \mu\text{s}$, 2 qubits — as emitted on the six physical channels

Nyquist mode $n=0$, shift $s=0.2067$ (bandwidth $K=1.210$); machine residual $9.0\text{e-}05$ (source) / $8.8\text{e-}05$ (shifted)

PSR (kick)

transport + gate + transport = $114.1\ \mu\text{s}$ of $119.8\ \mu\text{s}$ (95%)

NSR (waveform shift)

same geometry, one segment: $5.000\ \mu\text{s} = T$; amplitudes $\times 0.985$

gate AOM: measured shape, 696 ns ($|A|$ over the resolved carrier)

addressing Rabi comb: the shift is an amplitude change
